F.M.Jaeger & Smit, M.J., The temperature-coefficients of the free surface-energy of liquids at temperatures from -80° to 1650°C III. Measurements of some aromatic derivatives, in:
KNAW, Proceedings, 17 I, 1914, Amsterdam, 1914, pp. 386-394

Chemistry. — “*The Temperature-coefficients of the free Surface-energy of Liquids, at Temperatures from -80° to 1650° C.*

III. Measurements of some Aromatic Derivatives.” By Prof. Dr. F. M. JAEGER and M. J. SMIT. (Communicated by Prof. P. v. ROMBURGH).

§ 1. In continuation of our measurements of organic liquids, the data obtained in the study of a series of aromatic compounds, are reviewed here in tables, quite in the same way as in our former communications¹⁾. This series of substances includes the following terms:

Nitrobenzene; ortho-Nitrotoluene; Aniline; Dimethylaniline; ortho-Toluidine; Thymol; Methyl-, Ethyl-, and Benzyl-Benzoates; Salicylic Aldehyde; Acetophenone, and the non-aromatic compound: α -Campholenic Acid.

With respect to the determination of the specific gravities and the purification of the studied substances, we can refer to the preceding communication; the diagrams also have the same significance, as indicated there.

§ 2. Aromatic Derivatives.

I.

Nitrobenzene: $C_6H_5(NO_2)$.

*211.5	0.849	1132.6	26.6	0.965	968.8
Molecular weight: 212.10. Radius of the Capillary tube: 0.04439 cm.; in the observations indicated by *, this radius was: 0.04803 cm. Depth: 0.1 mm.					
The substance boils constantly at $308^{\circ}C.$; it can be undercooled as far as $-70^{\circ}C.$, and then crystallizes. The meltingpoint is somewhat higher than $+12^{\circ}C.$ At the boilingpoint χ is 22.6 Erg pro cm^2 . The density at $25^{\circ}C.$ is: $d_{40} = 1.1151$; at $50^{\circ}C.$: 1.0940; at $75^{\circ}C.$: 1.0724; at $t^{\circ}C.$: $d_{40} = 1.1357 - 0.000814t$.

191.7	0.664	885.2	20.6	0.889	
212	0.608	810.6	18.8	0.876	

Molecular weight: 168.13. Radius of the Capillary tube: 0.04 mm. Depth: 0.1 mm.

Under a pressure of 12 mm., the compound boils constantly at 153° C. Below 0° C. the liquid is extremely viscous; although the growing of the gas-bubbles lasted about 50 seconds, the measurement at -19° C. cannot be considered to be very reliable. The substance solidifies at -79° C.; above 160° C. it gets yellow by a slowly going decomposition.

25° " 45°	2,6		between -20° and +200°	2,29	
45° " 192°	2,21				
<i>Benzylbenzoate.</i>					
between -22° and +135°	2,70		<i>Salicylic Aldehyde.</i>		
135° " 160°	2,08		between 0° and 160°	1,98	
160° " 211°	1,66		160° " 190°	2,19	
<i>Acetophenone.</i>					
between 25° and 45°	2,99		<i>α-Campholenic Acid.</i>		
45° " 71°	2,45		between -19°,8 and 0°	cannot be determined	
71° " 90°	2,19		independently of		
90° " 160°	1,76		the viscosity		
160° " 200°	1,61		0° " 25°	3,39	
			25° " 45°	2,42	
			45° " 85°	2,12	
			85° " 117°	1,76	
			117° " 138°	1,59	
			Above 138° (decomposition) ca. 2,6		

Besides some straight lines, there are found here several curves for the dependence of μ and t , showing in contradistinction with the formerly described ones, the shape of that of water.

Groningen, June 1914. Laboratory for Inorganic Chemistry
of the University.
